

Grade Limited

Website — work of 17 September 2026

The 8 September feedback deck, closed in full — twelve of twelve items — followed by a responsiveness pass and an SEO fix that were not asked for but were found while testing.

Every figure in this report was measured on the running build rather than estimated, and every screenshot was taken from it.

Needs a person before go-live one checkbox in Directus (see the last page)

1 • The client's twelve

HOME 1 Hero slides no longer push the controls off-screen

Their words: *“the 1st one is okay, rest of them are exceeding the viewport height.”* Correct — slide one has no button and the other five do, and that button was enough to tip the hero past the fold on a short window. The hero is one viewport tall, but everything inside it was sized against the viewport’s *width*. Both the padding and the headline are now measured against height.

VIEWPORT	BEFORE	AFTER
1366 × 640	5px past the fold	fits
1280 × 600	36px past the fold	fits
1280 × 560	26px past the fold	fits
1440 × 800 · phones	fits	unchanged — nothing moved where nothing was wrong

HOME 2 “View the range” is see-through, matching the arrows

They named the Next/Prev buttons as the reference, so the button now carries their exact values rather than an approximation: deep blue at 22%, a white hairline border, a 2px blur.

Home hero, slide two. The button and the two arrows are now one treatment.

HOME 3 Search backdrop lighter and less blurry

It was near-black at 86% over a 3px blur. It now uses the product dialog's own backdrop — deep blue at 55% over 2px — so the two full-screen overlays on the site match, and the page stays legible behind the search instead of being blacked out.

Search open over the Home page.

HOME 4 Both sliders at 3 seconds

Hero 6.5s → 3s; the corporate client row 3.5s → 3s. Measured on the running build at 2.93 / 2.95 / 3.09 / 3.09 / 2.88 seconds.

Product images zoom on hover

One change covers both places, since the Home range cards and the category item cards are the same component. It began at the product dialog's 1.03 to match it exactly — and that read as *“too tiny to notice”*, rightly: the dialog's image is half as large again, so the same ratio is less movement on a card. At 1.08 a card grows 33px across, which is about what 1.03 looks like on the dialog.

At rest

Hovered — and the red border they objected to is gone

HOME 6 A button in the empty part of the footer

Their arrow pointed at the gap in the middle of the Home footer — it is empty because the social icons are suppressed on Home only. The same switch now picks between the two, so the space is never empty and never holds both. Label and link are both editable in the CMS, as asked.

Home footer. The button uses the hero slider's glass treatment, tinted with the deepest red of the footer's own ramp.

HOME 7 "See All" and the menu now reach a real page

Both used to jump to whichever range happened to be first, which put the menu's most general item on the site's most specific page. They now open `/products/`, built from their hand sketch: All Products and a picture, every range as a row, the active range's sub-categories beneath it, then the grid. They wrote "Fixed template" across the drawing, so it is the category template with one axis added rather than a second design.

`/products/` with Exercise Book active — the exact state their sketch drew, down to Student Large and Standard Large.

Changed after their review: switching range reloaded the page. It no longer does — both rows now filter in place, with zero page loads. That meant shipping all 38 products and their detail dialogs up front, which is why the page is larger in markup (28KB over the wire, compressed).

CATEGORY 2 The full-screen viewer zooms

Wheel to zoom from 1× to 4×, anchored on the cursor so what is under the pointer stays there, and drag to pan. The pan is clamped to the picture's own edges rather than the frame, so it cannot be dragged into the empty bands beside a letterboxed photograph.

A pack shot zoomed inside the viewer.

CONTACT 1 Phone and Email labelled

They screenshotted the footer as the target. The Contact page now matches it. The label sits outside the link, because “Phone:” is not a phone number and a screen reader would otherwise read it as part of the destination.

Contact page, address block.

COMMON 1 The WhatsApp button was eating clicks

The most serious item in the round and the smallest fix. The floating button is hidden until the footer scrolls into view — but it was hidden with `opacity: 0`, which hides paint and not hit-testing. A live 56px link therefore sat at the bottom-right of *every* page, directly over the hero's Next arrow. That is why their screenshot showed a `wa.me` address in the status bar while the cursor was on the arrow.

Verified after the fix: at the top of the page a hit test at the button's centre returns the page behind it; at the footer it returns the button; the Next arrow advances the slider again.

COMMON 2 Content no longer drifts to the middle of a wide screen

The layout capped at 1440px and centred, so every pixel beyond that went into the margins. The cap is gone; the margin now stops growing at 120px, the artboard's own gutter and the value you chose.

VIEWPORT	MARGIN BEFORE	MARGIN NOW
1440px	72px	72px — unchanged
1728px	230px	86px
1920px	336px	96px
2560px	680px	120px

Applied to the whole page, not only the header and hero they marked: the logo, the hero headline and the first section heading share one left edge at every width, and fixing two of the three would have left a 216px step at 1920 that reads as a mistake. Long paragraphs keep their own reading-width cap.

Home at 1920 wide.

2 · Found while testing — not requested

MOBILE Touch targets

A sweep of six pages at five widths found no horizontal overflow anywhere — the failure that makes a site feel broken on a phone is not happening. Three things were too small to tap:

CONTROL	BEFORE	AFTER
Hero slide dots	28 × 3 px	44 × 43 and 24 × 43 — the visible rule is unchanged
Sub-category filter tabs	44 × 36 px	44 × 44
Smallest type (client names)	11px	12px

Home on a phone

All Products on a phone

MOBILE Pinch to zoom

The zoom requested for the image viewer was wheel-and-drag, which does not exist on a phone — so on the device where looking closely at a pack shot matters most, there was no way to do it. One finger now pans, two pinch, and double-tap zooms to 2.5× and back.

SAFARI Tested in Safari's engine, not just Chrome

Run across iPhone 13, iPhone SE, iPad and desktop Safari profiles. Both engines behaved identically everywhere, so none of the findings were browser-specific — but the run did catch a real problem at 320px wide, a size narrower than the first sweep covered: the hero controls wrapped onto two lines and pushed the hero 47px past the fold. Fixed, and clean across all four profiles afterwards.

SEO All Products kept out of search results

Because `/products/` holds every range at once, it repeats all five category pages' catalogue in one document. Left indexable it would compete with the focused category pages for exactly the queries those pages are written for. It now carries `noindex, follow` — search sends people to the focused pages, while the ranking `/products/` receives still passes through to the pages it links to. It is also left out of the sitemap, since listing a noindexed URL asks a crawler to come and be told to go away.

3 · Before this goes live

One checkbox, in Directus

Content → All Products → seo_noindex → on

The automatic backfill cannot set this one: the field is created defaulting to “off”, and “off” is a real stored value rather than an empty one, so the fill-only-what-is-empty rule can never reach it. Without the tick, the page above stays in search results.

Three commands, on the server

Today added two fields on the site record and one new collection. A plain rebuild ships the new markup against empty columns, so the middle step matters:

<code>npm run directus:bootstrap -- --schema-only</code>	creates the columns
<code>npm run directus:bootstrap -- --fill-empty</code>	puts the values in them
<code>docker compose up -d --build site</code>	builds and restarts the site

The middle command writes only where a field is currently empty, so it cannot overwrite anything a moderator has edited.

Four things worth the client’s opinion

- **Footer button wording** — seeded as “Talk to us”, going to the contact page. They asked for a customisable label and did not say what it should say.
- **All Products banner picture** — their sketch says “Thematic Pic”; it currently uses the same photograph the Home hero opens on, so the two pages lead with the same image.
- **All Products banner wording** — “Every Range / Every Tool / Every Dream” echoes the Home hero closely enough that it may read as a repeat.
- **Hero photography** — still outstanding from the previous round. The frame is 2:1 and the photographs are about 1.4:1, so filling it discards roughly 30% of each picture’s height. A 2400 × 1200 re-crop fixes it with nothing cropped and no filler. They already have the shots.

Also still open, from earlier rounds

The content backlog from 29 August and 7 September — 28 values in Directus — is unaffected by today’s work and still outstanding. It is listed field by field in `docs/feedback/production-content-changes.md`.
